

Srikanth Sastry

Privacy & Data Protection Infrastructure

contact

Boston/Cambridge, MA
+1 (504) 272 7879
srikanthsastry@gmail.com
srikanth.sastry.name

expertise

Data protection
architecture
Access control &
governance
Privacy threat modeling
Distributed systems
Reliability / performance
Enforcement system
design

languages

Python, Java, Rust, SQL

leadership

Architecture ownership
Cross-org execution
Technical strategy

Privacy infrastructure engineer with 13+ years building high-availability distributed systems. Data protection and governance at petabyte scale; translates regulatory requirements into system-verifiable invariants.

experience

2017–Present **Meta**

Cambridge, MA

Privacy Infrastructure – Data Platform & Governance

2019–Present

- **Data Protection Enforcement (Big Data):** Shipped data protection enforcement for batch platforms (Spark, Presto, Hive) at 3 PiB/day ingestion and 500+ PiB/day reads across 30k+ data flows; achieved >99% enforcement reliability with 1000x cost reduction over three years.
- **Request-Time Data Access Control:** Architected sub-100ms data access enforcement for the online request path; leading phased rollout (10k QPS peak; designed for 300k+) with correctness-first failure modes.
- **Training Data Compliance:** Architecting data governance framework for pre-training compliance: content provenance, regulatory filtering, and policy enforcement before ingestion into model training pipelines.
- **Data Deletion & Anonymization:** Built purge systems for deleted account data under FTC Consent Decree across 3k+ datasets; automated reanonymization of petabytes of warehouse data.
- **Governance & Access Policy Framework:** Defined commitment-agnostic policy specifications for data access control aligned with GDPR, CCPA, DMA; built data lineage, purpose limitation, and access auditing into the governance framework.
- **Technical Leadership:** Architecture owner for data protection enforcement across Meta's data platform; led privacy threat modeling and security reviews; set technical standards and mentored a 12-engineer core team while influencing 35+ engineers cross-org on data protection strategy.

Content Delivery / Edge Infrastructure

2017–18

- Redesigned CDN load-balancer deployment to improve reliability and reduce capacity overhead via independent component scaling.

2013–2017

Google

New York, NY and Cambridge, MA

Google Flight Search

- Scaled backend capacity for 7x skewed long-tail queries, increasing throughput.
- Reduced median query latency by 60ms and increased peak compute utilization from 66% to 87% while meeting latency SLOs.

2001–2004

Cisco Systems - Software Engineer (IOS routing/switching)

Bangalore, India

education

2011–2013

Postdoctoral Researcher

CSAIL, MIT

Theory of distributed systems.

2004–2011

Ph.D. in Computer Engineering

Texas A&M University

Fault tolerant distributed systems.
